

Forklift Fork Positioner

Fork Positioner for Forklifts - A fork positioner is a device made out of top quality materials designed to be able to withstand the most challenging operations and work environments. This piece of equipment can enable the individual driving to be able to control the forks hydraulically without leaving the seat. Side shifting units have the added ability to laterally position the arms or the entire load so as to facilitate more precise carrying and placement in a quicker and more effective way.

The unique blade pocket design could enable the one operating it to be able to securely swing the unit's forks without any fear of damaging the positioning cylinders. This could allow the worker the alternative to either perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most forklifts with non-OEM carriages, complete carriages are needed. Standard OEM carriages can be transformed into blade positioners on available units.
